

What is the ordered rooted tree that represents the expression
 $((x+y)\uparrow 2) + ((x-4)/3)$?

$$((\underline{x+y})\uparrow \underline{2}) \neq ((\underline{x-y})+\underline{z})$$

$$((x+y)\uparrow 2) + ((x-4)/3).$$

Infix notation.

What is the prefix form for $((x+y)\uparrow 2) + ((x-4)/3)$?

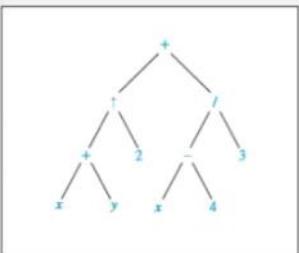

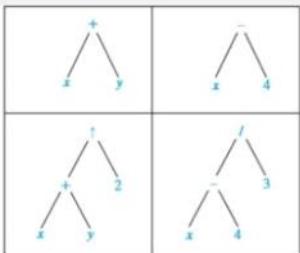

$$((\underline{+xy})\uparrow \underline{2}) + ((\underline{-x4})/\underline{3})$$

A binary tree representing $((x+y) \uparrow 2) + ((x-4)/3)$.

Solution: We obtain the prefix form for this expression by traversing the binary tree that represents it in preorder
This produces $+ \uparrow x y 2 / - x 4 3$.

 $((x+y) \uparrow 2) + ((x-4)/3)$?

$$\begin{aligned} & ((\underline{xy+}) \uparrow 2) + ((\underline{x4-}) / \underline{3}) \\ & (\underline{xy+} \uparrow 2) + (\underline{x4-} / \underline{3}) \end{aligned}$$

$$\underline{x4+2 \uparrow} \underline{x4-3 /} +$$

What is the postfix form of the expression $((x+y) \uparrow 2) + ((x-4)/3)$?

Solution: The postfix form of the expression is obtained by carrying out a postorder traversal of the binary tree for this expression
This produces the postfix expression: $x y + 2 \uparrow x 4 - 3 / +$.

When one integer is divided by a second non-zero integer, the quotient may or may not be an integer. For example, $\frac{12}{4} = 3$, an integer but $\frac{11}{4} = 2.75$, not an integer.

$$\begin{array}{r} \cancel{1} \quad \frac{12}{4} = \boxed{3} \quad \Rightarrow \cancel{1} \cancel{2} = \cancel{4} \cancel{3} \\ 4 \cancel{\times} 11 \end{array}$$
$$\frac{11}{4} = \boxed{2.75} \Rightarrow 4 \cancel{\times} 11 \quad \frac{b}{a} \mid a = \frac{a}{b}$$
$$b \mid a = \frac{a}{b}$$

Let $a \in \mathbb{Z}$ be any integer.
and b is a +ve integer
then we say that b divides a .

if \exists an integer c s.t
 $\frac{a}{b} = c$

or $a = b \cdot c$

$\cancel{a} = \cancel{b} \cancel{c}$

What are the quotient and remainder when -11 is divided by 3?

- A. -4,1
- B. -3,1

Answer : A.

Theorem 1 : Let a and b be integers, and let m be a positive integer. Then, $a \equiv b \pmod{m}$ if and only if $a \text{ mod } m = b \text{ mod } m$.

Example: Determine whether 17 is congruent to 5 modulo 6?

Solution : We have $17 - 5 = 12$ and 6 divides 12 as $12/6 = 2$, an integer, so 17 is congruent to 5 modulo 6. That is,

$$17 \equiv 5 \pmod{6}.$$

$a \equiv b \pmod{m}$
if $m | (a - b)$

$17 \equiv 5 \pmod{6}$
 $6 | 17 - 5$
 $6 | 12$

$$17 \equiv 5 \pmod{6}$$

$$6 \mid 17-5$$

$$6 \mid 12$$

$$13 \equiv 8 \pmod{4}$$

$$\begin{array}{r} 4 \nmid 13-8 \\ 4 \nmid 5 \end{array}$$

$$26 \equiv 1 \pmod{5}$$

Modular Arithmetic

$$\begin{array}{l} a \equiv b \pmod{m} \\ a = mk + b \end{array}$$

Theorem 2 : Let m be a positive integer. The integers a and b are congruent modulo m if and only if there is an integer k such that $a = b + km$.

Theorem 3 : Let m be a positive integer. If $a \equiv b \pmod{m}$ and $c \equiv d \pmod{m}$, then

$$a+c \equiv b+d \pmod{m}, \quad ac \equiv bd \pmod{m}.$$

$$11 \equiv 2 \pmod{3},$$

$$10 \equiv 1 \pmod{3}$$

$$21 \equiv 0 \pmod{3}$$

$$110 \equiv 2 \pmod{3}$$

$$21 = 0 \pmod{3}$$

$$\begin{array}{l} a \equiv b \pmod{m} \\ m \mid (a-b) \\ \therefore \exists \text{ an integer } k \text{ s.t. } \frac{a-b}{m} = k \\ a-b = mk \\ a = mk+b \end{array}$$

$$a \equiv b \pmod{m}$$

$$m \mid (a-b)$$

$\therefore \exists$ an integer k s.t.

$$\frac{a-b}{m} = k$$

$$a-b = mk$$

$$a = mk+b$$

$$26 \equiv 2 \pmod{3}$$

$$25 \equiv 1 \pmod{3}$$

$$26 \times 25 \equiv 2 \pmod{3}$$
